Summary

Computer science undergraduate seeking a Security Intern role. Brings hands-on cryptographic attack scripting, documented vulnerability analysis in CTF settings, and backend/API development experience. Interested in applying these skills to security testing, investigation and clear technical reporting.

Education

VNUHCM – University of Science Sep 2024 – Sep 2028 (expected)
Advanced Program in Computer Science (APCS) | GPA: 4.0/4.0

High School for the Gifted, VNUHCM Sep 2021 – Jun 2024
Specialized in Mathematics | GPA: 9.6/10

Technical Skills

Security: RSA/ECC and symmetric-cryptography analysis; Python, SageMath, pwntools; GDB, Ghidra, Wireshark, Nmap.
Engineering: C/C++, SQL, Flask, FastAPI, MongoDB, Git, Docker, Linux; backend APIs and DevOps.
Problem solving: Codeforces Candidate Master; LeetCode Top 1%; CryptoHack #122 globally.

Projects

Cryptanalysis & CTF Practice Jan 2026 – Sep 2026
Independent security practice | Python, SageMath, pwntools

- Developed SageMath/Python exploits for advanced challenges involving lattices, p-adic methods, elliptic-curve isogenies, hash length extension, polynomial attacks and custom block ciphers.
- Published reproducible writeups that trace each weakness from source-code review and mathematical analysis to exploit and verification.
- After completing the team's cryptography tasks, used reverse-engineering and network-analysis tools to assist teammates with other categories during contest finals.

Hybrid Destination Recommender Oct 2025 – Dec 2025
Backend APIs & deployment | Python, Flask, MongoDB, Firebase

- Planned and built backend APIs, connected MongoDB and Firebase, and deployed a conversational application with context-aware routing and personalized retrieval.
- Added request rate limiting and Firebase Security Rules to reduce abusive traffic and restrict unauthorized data access; validated core interactions with Playwright tests.

Temporal Path Computation Jan 2025 – Apr 2025
Algorithm implementation and performance evaluation | C++, Python

- Translated temporal-path algorithms from a research paper into optimized C++, implementing streaming and transformed-graph approaches.
- Built runtime benchmarks to compare graph-processing approaches and separate preprocessing from query costs.

Honors & Awards

- **HCMUS-CTF 2026, Talent Division:** Top 6 of 15 teams (2026).
- **UIT WannaGame Championship:** 1st place among 200+ teams (2025).
- **HCMUS-CTF 2025, Prospect Division:** Qualified for the finals (2025).
- **APCS entrance scholarship:** Top 5 in the entrance test; awarded 100% tuition coverage for the first year.

CTF team contribution: served as the primary cryptography contributor in the competitions listed above.
